

# Git Command Cheat Sheet

Quick branch check: `git status` | `git branch (*)` | `git rev-parse --abbrev-ref HEAD`

Command	Purpose	Notes / Example Output
<code>git config --global user.name "Name"</code>	Set global username	Used for commit author info
<code>git config --global user.email "Email"</code>	Set global email	Should match GitHub account
<code>git config --global init.defaultBranch main</code>	Change default branch to main	Set once
<code>git init</code>	Initialize local repository	Creates .git folder
<code>git clone &lt;URL&gt;</code>	Clone from remote repository	Default folder = repo name
<code>git status</code>	Check status and branch	On branch main
<code>git add &lt;file&gt;</code>	Stage changes	<code>git add .</code> = stage all
<code>git commit -m "message"</code>	Commit staged changes	Use meaningful messages
<code>git log --oneline --graph</code>	Show concise commit history	Includes branch graph
<code>git branch</code>	List local branches	* marks current branch
<code>git switch &lt;branch&gt;</code>	Switch branches (new syntax)	Same as checkout
<code>git switch -c &lt;branch&gt;</code>	Create and switch to new branch	Same as checkout -b
<code>git remote -v</code>	List remote repositories	Shows fetch/push URLs
<code>git remote add origin &lt;URL&gt;</code>	Add remote	Common name is origin
<code>git remote set-url origin &lt;URL&gt;</code>	Change remote URL	Switch HTTPS/SSH
<code>git fetch</code>	Fetch remote updates (no merge)	Updates origin/* refs
<code>git pull</code>	Fetch and merge updates	Equivalent to fetch + merge
<code>git pull --rebase origin &lt;branch&gt;</code>	Fetch and reapply commits	Avoids extra merge commits
<code>git push -u origin &lt;branch&gt;</code>	Push and set tracking	Needed for first push
<code>git push</code>	Push to tracked remote branch	Requires tracking branch
<code>git restore &lt;file&gt;</code>	Discard local changes	Only for tracked files
<code>git restore --staged &lt;file&gt;</code>	Unstage file	Keep working directory changes
<code>git reset --hard HEAD~1</code>	Reset to previous commit	Dangerous: loses changes
<code>git revert &lt;commit&gt;</code>	Revert commit with new commit	Safe: keeps history

nothing added to commit but untracked files present → Run: `git add` then `git commit`

rejected / non-fast-forward → Sync first: `git pull --rebase origin` , then `git push`

error: src refspec does not match any → Branch has no commits; commit at least once first
